

CLAIMS

1. A hydraulic fluid tank (1) comprising:
 - a ceiling (2) and a bottom (3); and
 - a hydraulic fluid feed orifice (11), which feed

5 orifice is placed in the ceiling and opens out to the outside of the tank, the tank being characterized in that an anti-overflow partition (16) is placed inside the tank extending at least from the ceiling and surrounding the feed orifice at least in part.
- 10 2. A tank according to claim 1, characterized in that the anti-overflow partition is fixed perpendicularly to the ceiling of the tank.
- 15 3. A tank according to claim 1 or claim 2, characterized in that the anti-overflow partition is U-shaped.
4. A tank according to any one of claims 1 to 3, characterized in that the anti-overflow partition is
- 20 fixed to the bottom of the tank.
5. A tank according to any one of claims 1 to 3, characterized in that the anti-overflow partition is fixed solely to the ceiling of the tank.
- 25 6. A tank according to any one of claims 1 to 5, characterized in that the tank includes a wall connecting the ceiling to the bottom, which wall is provided with stiffening ribs (44) that are preferably fixed
- 30 perpendicularly thereto.
7. A tank according to any one of claims 1 to 6, characterized in that the anti-overflow partition comprises a first portion (29) extending part of the way
- 35 around the feed orifice, and a second portion (30) extending around a periphery (31) of the tank.

8. A tank according to claim 7, characterized in that the second portion of the anti-overflow partition surrounding the periphery of the tank includes a series of corrugations (43).

5

9. A tank according to claim 8, characterized in that each corrugation in the second portion of the anti-overflow partition is positioned in such a manner as to be placed in register with a stiffening rib (44).
